CHAPTER 8: ANALOG FILTERS

SECTION 8.1: INTRODUCTION Filters

are networks that process signals in a frequency-dependent manner. The basic concept of a filter can be explained by examining the frequency dependent nature of the impedance of capacitors and inductors. Consider a voltage divider where the shunt leg is a reactive impedance.

CHAPTER 8 ANALOG FILTERS

The design of matching networks shares much in common with filters and the design invariably will have a filtering action as an incidental consequence.

Although the prime purpose of a matching network is not to filter, it is often the case that both functions are combined in the same circuit.
