Bottom Line: Analog
vs Digital Signals.

Analog signals
represent one
continuous variable
as the result of
another continuous
time-based variable.
They are capable of

outputting continuous information with a theoretically infinite number of possible values. We have seen analog signals in use in nearly every type of signal processing and consumer electronics application imaginable.

~~Difference? — Guru99~~

An Analog signal is any continuous signal for which the time varying feature (variable) of the signal is a representation of

some other time varying quantity, i.e., analogous to another time varying signal. It differs from a digital signal in terms of small fluctuations in the signal which are meaningful. A digital signal uses discrete (discontinuous) values. By contrast, non-digital (or analog) systems use a

Digital signals and objects deal in the realm of the discrete or finite, meaning there is a limited set of values they can be. That could mean just two total possible values, 255, 4,294,967,296, or anything as long as it's not (infinity).

Analog signals are the signals that are continuous in nature and keep on changing with time. On the flip side, digital signals are the discrete types
