The molecular dipole determines the overall polarity of the molecule and how it interacts with other molecules and its environment. BTW: The molecular dipole is found by adding the bond dipoles together while taking into account the direction of the bond dipole; think a tug-of-war. Take some time and adjust each of the atom's locations and electronegativity values several times.

The molecule is polar because it does not have the same charge. H=Positive charge. F=Negative charge. H₂O (water) The molecule is polar, because it doesn ' t have the same charge. H₁ and H₂=Have a positive and an electrostatic potential charge. O=Negative charge. CH₂F₂ Is polar because, it have some charges that have atoms that are positive and negative.
