Nanolithography |  
ScienceDirect

Nanolithography is the art of making structures on the nanometre scale. This might be used for creating integrated circuits and parts for semiconductor technology, where being able to manufacture the smallest possible transistors and circuits not only allows for creation of smaller devices but can help increase the power efficiency and performance of the components.<sup>1</sup>.

## Fabricating ...

Nanolithography is the art and science of etching, writing, or printing at the microscopic level, where the dimensions of characters are on the order of nanometers (units of  $10^{-9}$  meter, or millionths of a millimeter). This includes various methods of modifying semiconductor chips at the atomic level for the purpose of fabricating integrated circuits ( IC s).

large areas of parallel nanofluidic channels. 30 Focused-ion-beam milling on silicon nitride surfaces has been employed to make precise nanofluidic channel arrays. 31 An electron beam lithography approach for nanofluidic channel fabrication has employed a bilayer resist and thermal reflowing of a top layer of PMMA to seal channels in a bottom layer of photoresist. 32 Among other methods, atomic ...
